

ECODRY SUBWATER KIT

FOR SWIMMING POOLS

For Waterproofing of swimming pools, Revestech offers the **ECODRY SUBWATER KIT**. A complete system with eco-responsible membrane **ECODRY120 20**, joint band **ECODRY50 BANDA 13X30** and **KIT POOL** adhesive and primer.

The watertightness of swimming pools requires combining the waterproofing of the support thanks to the **ECODRY SUBWATER KIT** with the ceramic tiles; thus forming a watertight area, where the pieces are joined with the previous waterproofing.

ECODRY120 is a multilayer waterproofing membrane specially designed to guarantee the total watertightness of the vessel either in new construction and in rehabilitation of all types of swimming pools, cisterns and water tanks in general, through the fully adhered installation. Its versatility means that it is not necessary to remove, in most cases, the ceramic coating existing. It is made up of a high-performance CPE (EVA-based) thermoplastic polyolefin polymeric membrane. Circular Polymer), resulting from the transformation and treatment of circular economy raw materials, and extruded on polyester and polypropylene fibers. In addition, they have the EPD sustainability certification and the CE marking according to the EN standard. 13956:2013.

Even though a high-performance system, the watertightness of a swimming pool goes further and requires a superior training, due to the own nature of the type of installation that supports hydrostatic pressure on the bottom. And since we are specialists, professional and responsible, we want to do things right, so this system is exclusively for trained and approved installers by Revestech. For this, we offer you free training, approved installer diploma, technical advice by phone and on-site assistance.
