

# DRY SUBWATER KIT

## FOR SWIMMING POOLS

For Waterproofing of swimming pools, Revestech offers the **DRY SUBWATER KIT**. A complete system with eco-responsible membrane **DRY120 20**, joint band **DRY50 BANDA 13X30** and **KIT POOL** adhesive and primer.

The watertightness of swimming pools requires combining the waterproofing of the support thanks to the **DRY SUBWATER KIT** with the ceramic tiles; thus forming a watertight area, where the pieces are joined with the previous waterproofing.

**DRY120** is a multilayer waterproofing membrane specially designed to guarantee the total watertightness of the vessel either in new construction and in rehabilitation of all types of swimming pools, cisterns and water tanks in general, through the fully adhered installation. Its versatility means that it is not necessary to remove, in most cases, the ceramic coating existing. Built an EVA copolymer and covered on polyester and polypropylene fibers. One of them specially developed for adhesion to the existing coating, draining the moisture without causing bubbles. Both sides allow optimal grip with the C2 S1/S2 tile adhesive used in its installation as fully adhered membrane. The joints must be made edge to edge, they must be sealed with the help of **DRY50 BAND** strips and **SEALPLUS** adhesive.

Even though a high-performance system, the watertightness of a swimming pool goes further and requires a superior training, due to the own nature of the type of installation that supports hydrostatic pressure on the bottom. And since we are specialists, professional and responsible, we want to do things right, so this system is exclusively for trained and approved installers by Revestech. For this, we offer you free training, approved installer diploma, technical advice by phone and on-site assistance.
